

Automated Blog Post Generator

Overview

This project automates the creation of professional blog posts about trending books on Amazon. It combines web scraping, structured content generation using templates, and language model-based enhancement with google/flan-t5-large. The tool is ideal for bloggers, content marketers, and affiliate publishers looking to streamline book promotion and review writing.

Technologies Used

Component	Purpose
Python	Core scripting language
Selenium	Web scraping and browser automation for retrieving Amazon book data
Hugging Face Transformers	Text generation using a pre-trained model
FLAN-T5-Large	Generates high-quality, human-like blog content
Amazon Books	Source of trending product data

Workflow Summary

1. Web Scraping:

- The script navigates to Amazon's Best Sellers in Books page.
- It extracts the title, author, rating, and product link for the top-listed book.

2. Template-Based Blog Creation:

- A predefined blog post template is populated with the scraped information.
- This ensures a consistent structure and professional presentation.

3. Content Enhancement with Language Model:

- The initial blog content is passed to the google/flan-t5-large model.
- The model refines the blog by improving language fluency, coherence, and style.

4. Output:

- The final blog post is printed to the console and ready to be published or stored.

Features

- Real-time scraping of trending book data
- Headless Chrome scraping using Selenium
- Template-driven, structured content layout
- Enhanced natural language output using a fine-tuned text generation model
- Graceful handling of missing author or rating information

Potential Improvements

- Automate processing for the top 10 or more books
- Include book cover images in the output
- Integrate with WordPress or Medium for auto-publishing
- Add multilingual support for international audiences
- Enable export of blog posts to PDF or Markdown formats
